The command 'git clone https://github.com/WiringPi/WiringPi' is executed, followed by 'cd WiringPi' and './build'. The output shows the cloning process, including object enumeration, counting, and compression, and the final build command execution.

4) raspberry pi rtscts 설정 프로그램 다운로드 및 코드수정, 빌드  
git clone <https://github.com/codezoo-ltd/rpirtscts.git>

해당 프로그램은 모뎀을 사용하기 위해 라즈베리파이의 Serial CTS/RTS 기능을 활성화하고 모뎀 내장 or 외장 안테나 사용 설정 후 모뎀을 하드웨어 리셋 합니다.

```
₩>cd rpirtscts
```

```
₩>vi rpirtscts.c
```

(!) 외장 안테나를 사용할 경우, `if(!system("gpio -g write 5 1"))` 로 수정 합니다.

```
/* Type1SC Modem Using Internal Antenna */
if(!system("gpio -g mode 5 output"))
    printf("gpio5 output mode\n");
if(!system("gpio -g write 5 0"))
    printf("EXT ANT OFF.\n");
if(!system("sleep 1"))
    printf("...\n");

/* Type1SC Modem Reset */
if(!system("gpio -g mode 26 output"))
    printf("gpio26 output mode\n");
if(!system("gpio -g write 26 0"))
    printf("Modem Reset.\n");
if(!system("sleep 1"))
    printf("Modem Reset..\n");
if(!system("gpio -g write 26 1"))
    printf("Modem Reset...\n");
if(!system("sleep 1"))
    printf("Modem Ready!!!\n");
```

## 4. CAT.M1 PPP install

# FAQ. Ping Test 안될때

```
jbmaster@raspberrypi:~ $ ping www.google.com -c 10
ping: www.google.com: Temporary failure in name resolution
jbmaster@raspberrypi:~ $ sudo sh -c 'echo "nameserver 8.8.8.8">>/etc/resolv.conf'
```

1) ping 테스트 할때 Temporary failure in name resolution 출력되고 테스트 진행이 되지 않으면 아래와 같이 nameserver를 다시 지정 합니다.

```
₩>sudo sh -c 'echo "nameserver 8.8.8.8">>/etc/resolv.conf'
```

- 끝 -

감사합니다.
